

Hawaii Workstation Updates and Tips (June 2025)

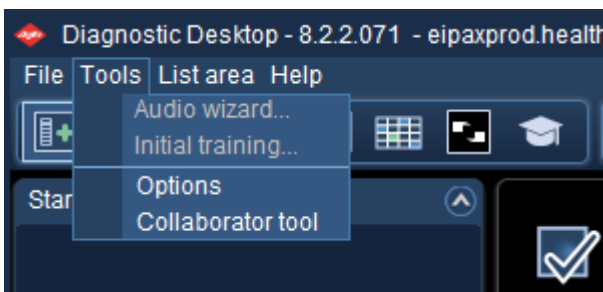

- The internet connection for the workstation has been upgraded from 200/10 Mbps download/upload speed to 1000/50 Mbps. Practically, this doesn't make a large difference in performance as the maximum VPN throughput is around 300 Mbps, however this is faster than any of the home workstations over the Cisco AnyConnect VPN and faster than the Summa off-sites like Green or Medina.
- The router in the office has a separate WiFi network that you can use for your personal devices if the signal strength from the condo WiFi is too weak. I'd recommend NOT giving the credentials to the rest of your friends/family in the condo, as it shares bandwidth with the workstation and could slow down your work if others are using it for Netflix, etc. SSID is SpectrumSetup-B05C Password: modernsilver76
- The Meraki VPN (silver box) has been configured to failover and use the condo internet as a backup in case the office router or modem goes down. You probably won't even notice if it happens, and there's nothing you need to do to enable or disable it.
- The Summa-owned HP workstation has been replaced with one of our remote workstations, which are faster overall. The Summa workstation will still function as a backup if the ARI station fails for whatever reason. There's also a second spare ARI workstation in the office. There is a spare diagnostic monitor and a spare worklist monitor in the master bedroom closet on the right side near the window.
- Summa IT has installed Palo Alto's GlobalProtect VPN and security software on the Hawaii workstation. This will eventually be deployed to our home workstations and replace the Cisco AnyConnect VPN client. You'll see a little globe icon in the bottom right of the worklist monitor. It'll flash for a few seconds when you first log in and may prompt you for your Summa email and password. If it doesn't connect for some reason, you won't be able to access PACS or any other network resources. Call Summa IT if this happens.

- Despite the internet bandwidth upgrades, there's still a fairly long delay in logging in to the workstation due to Summa IT security checks and the long latency from being 5000 miles from Akron. After logging into Windows, there's an approximately 8 minute black screen delay before reaching the desktop. When logging into Powerscribe, there can be up to a 15 minute delay retrieving speech profiles and macros (although sometimes this only takes 2-3 minutes). In a worst-case scenario, it could take 20-30 minutes to turn on the workstation and be ready to dictate, so please plan accordingly. To mitigate this delay, you could log in to the workstation and PACS well ahead of your shift and either turn off the collaborator (so you don't get messages from techs thinking you're already working) or set yourself as "Do Not Disturb" on the Collaborator tool. You can temporarily turn off the Collaborator tool by clicking "Exit" on the dialog box as below:

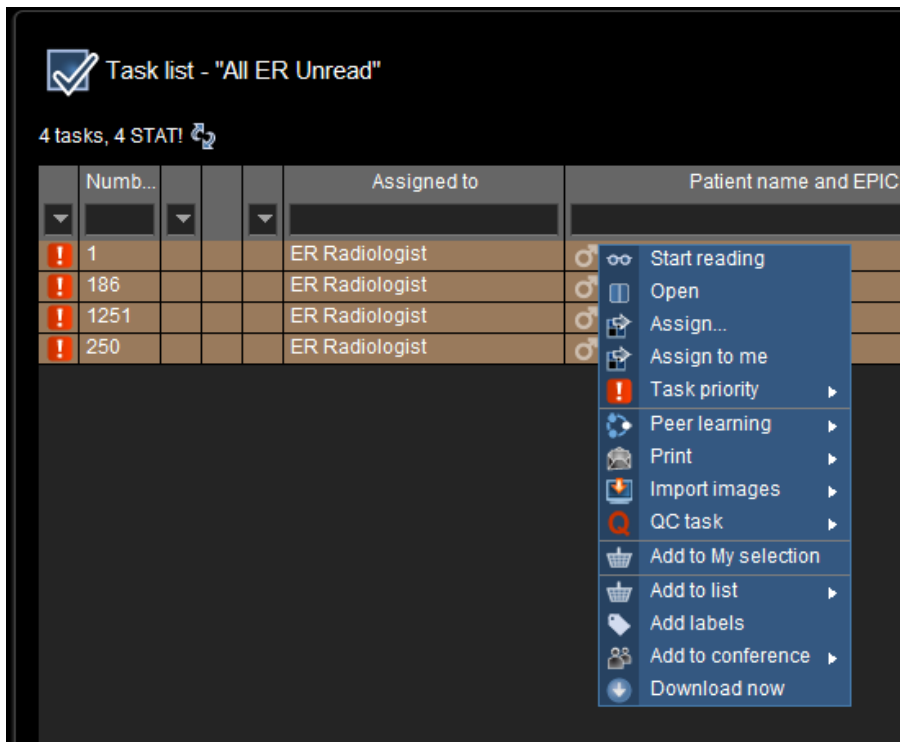

When you're ready to start your shift, turn the Collaborator tool back on from the worklist monitor as shown below:

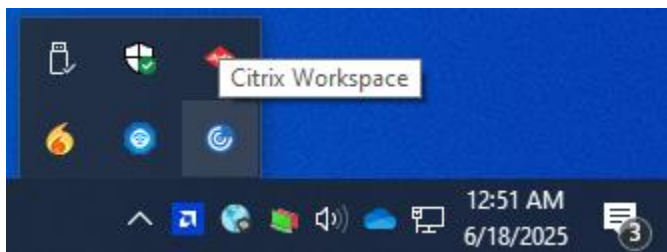

At the end of your shift, instead of shutting the workstation down completely and having to go through the black screen delay after logging in again, you can instead lock the workstation by pressing the Windows key + L.

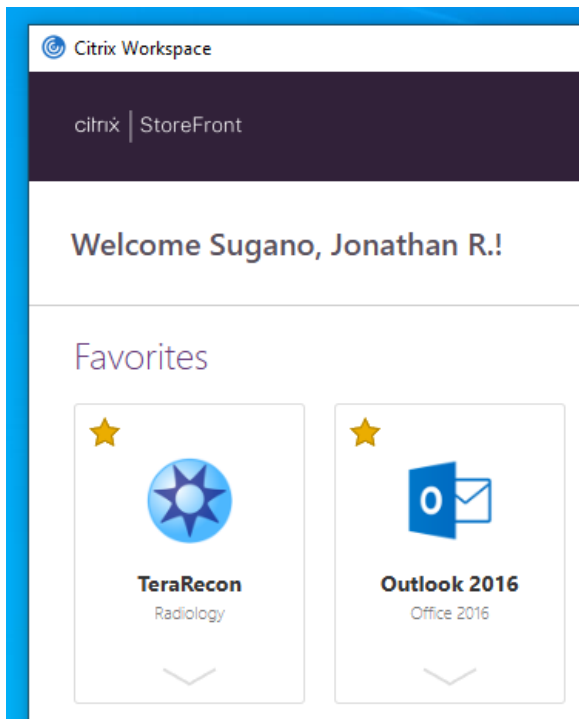

- If studies seem to be loading unusually slowly for some reason, you can pre-download cases to your workstation by right-clicking on one or several of them and selecting “Download now”. The selected cases will download in the background while you’re doing other work. I haven’t needed to use this during my recent shifts in Hawaii, but it can be useful when reading from home during the daytime when there are more VPN users and the network can get congested.

- The native TeraRecon application is unusable in Hawaii. The Citrix app, while not a great experience, is at least functional. To launch TeraRecon through Citrix, first open the Citrix Workspace app from the taskbar at the bottom right of the worklist monitor:

From the Citrix Workspace app, you can launch TeraRecon from the icon:

If the TeraRecon app is marked as a Favorite in the Workspace page, you can make a desktop or toolbar shortcut to the Citrix version. Find the icon under the Citrix folder in the Windows start menu, and drag it either to the desktop or the toolbar:
